

CLASSES EXERCISE 1

Skills: Classes, extended classes, and methods

Create a class called "BankAccount"

Properties:

- balance
- interestRate

Methods:

- addInterest() // increases the balance by adding the appropriate interest

Next, create a subclass called "BankAccountWithFee"

It inherits all the properties and methods from BankAccount and adds the following.

Properties:

- fee // a fixed dollar amount fee

Methods:

- applyFee() // subtracts the fee from the balance

Create a few instances (a.k.a. objects) of each class, and test them out by calling the methods.
